DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-19 are rejected under 35 U.S.C. 102(e) as being anticipated by RE 38,400 to Kowall et al. Kowall et al discloses a power operated lift gate of a vehicle (10) enabling the lift gate (14) to be moved from a closed position to a plurality of open positions, the vehicle further comprising;

a motor (28) coupled to the lift gate and arranged to move the gate from the closed position to any of the open positions; detecting means (108) for detecting resistance to opening movement of the door; and a processor (102) coupled to the detecting means and the motor for receiving the detected resistance to the opening movement of the lift gate and directing the motor to stop the opening movement of the lift gate when the detected resistance is above a threshold.

As to claims 3, 4, 7, 8, 11-13 and 15-17, Kowall et al (col. 7, lines 65-67 & col. 8, lines 1-49) further discloses various obstruction detecting methods, such as, using a detection circuit or sensor to monitor the speed of the motor. A second method uses temperature sensors to detect any excessive heat causing abnormal current to the motor and the third method uses a pressure sensor (106) defining a sensitive surface, which measures the rate of change of the lift gate relative to the rate of voltage (normal motor velocity) necessary to move the lift gate in an

opening direction. All three of these methods monitor force or torque applied to the motor or lift gate at which an obstruction is assumed defining the threshold and the motor is directed to shut off and can only be switched to an operable position again by a user's identification switch device, such as a remote entry fob.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Greif, Ciavaglia et al, Kato and Hellinga et al disclose various power operating door devices capable of meeting the limitations of applicant's base claims whether taken alone or used in combination.
